

TierOne Trading

How to Start Receiving Buy & Sell Signals on Telegram

Step-by-step guide · takes about 15 minutes · updated July 5, 2026

This guide walks you from zero to receiving live trading signals on your phone. The app scans US-listed stocks priced at \$5 or less (NASDAQ, NYSE, AMEX — never OTC) during premarket (7:00–9:30 AM), regular hours (9:30 AM–4:00 PM), and after-hours (4:00–8:00 PM Eastern). When a setup appears, you get a Telegram message with the exact buy entry price and sell entry price, computed so your profit is at least 3% **after** slippage, spreads, and SEC/FINRA fees.

You only do this setup once. After that, starting the app is a single command.

Before You Start — What You Need

- A Windows PC that can stay on during market hours (this runs the scanner).
- The TierOneTrading folder (on your Desktop).
- The Telegram app on your phone (free — App Store / Google Play).
- About 15 minutes.

Step 1 — Install Python (one time)

1. In a web browser, go to **python.org/downloads** and click the yellow download button (Python 3.11 or newer).
2. Run the installer. On the **FIRST** screen, check the box at the bottom that says “**Add Python to PATH.**” This checkbox is easy to miss and everything breaks without it.
3. Click “Install Now” and let it finish.

Already have Python? Skip to Step 2.

Step 2 — Install the App's Libraries (one time)

1. Press the **Windows key**, type **cmd**, press Enter. A black window opens — this is the Command Prompt. All commands below get typed here.
2. Type these two lines, pressing Enter after each:

```
cd C:\Users\tjcas\Desktop\TierOneTrading  
pip install -r requirements.txt
```

Wait for the downloads to finish (a minute or two). Warnings in yellow are fine; only red errors matter.

Step 3 — Create Your Telegram Bot (2 minutes)

Your bot is the “phone number” the signals come from. You create it inside Telegram — no coding involved.

1. Open Telegram on your phone. Tap the search icon and type **BotFather**. Open the one with the blue verified checkmark.
2. Tap Start, then send the message: **/newbot**
3. It asks for a **name** (what people see). Reply with something like: **TierOne Signals**
4. It asks for a **username**. This must be unique and end in “bot”, e.g. **TierOneTcBot**. If taken, try another.
5. BotFather replies with a message containing your **token** — a long string like:
`7712345678:AAH9xGqK3mP-eXaMpLeToKeN_dQw4w9WgXcQ`
6. Tap the token to copy it. Keep it secret — anyone with the token controls the bot.

Step 4 — Put the Token in config.yaml

1. Open the **TierOneTrading** folder on your Desktop.
2. Right-click **config.yaml** → Open with → **Notepad**.
3. Find the telegram section and paste your token between the quotes:

```
telegram:
  bot_token: "7712345678:AAH9xGqK3mP-eXaMpLe..."
  admin_chat_id: ""
```

4. Save the file (Ctrl+S). Leave admin_chat_id empty for now — that's Step 5.

Step 5 — Get Your Chat ID (automatic)

The chat ID tells the app which Telegram account is YOU (the admin). A helper script finds it for you.

1. In the Command Prompt (still in the TierOneTrading folder), run:
2. It confirms your token works and tells you to message your bot.
3. On your phone: search Telegram for your bot's username (e.g. @TierOneTcBot), tap Start or send it “hi”.
4. Within seconds the script prints your chat ID:

```
Found it! Tc's chat ID is: 123456789
```

```
Put this in config.yaml:
  admin_chat_id: "123456789"
```

5. Open config.yaml in Notepad again, paste the number into admin_chat_id (inside the quotes), and save.

Step 6 — Start the App

```
cd C:\Users\tjcas\Desktop\TierOneTrading  
python main.py
```

Within a few seconds your phone should buzz with:

```
■ TierOne Trading online – mode: signals only
```

That message means you're done. Leave the black window open — that's the engine. It sleeps outside market hours and starts scanning automatically at 7:00 AM ET on trading days.

Keep the PC awake: Windows Settings → System → Power → set sleep to **Never** (at least while plugged in). If the PC sleeps, signals stop.

To stop the app: click the black window and press Ctrl+C. To restart it any day: repeat this step.

How to Read a Signal

■ BUY SNDL [premarket] [SIGNAL ONLY]

Setup: VWAP dip – 1.4% under VWAP, RSI 27

Last: \$1.9400

BUY ENTRY (limit): \$1.9449

SELL ENTRY (limit): \$2.0163 (+3.0% net)

Stretch target: \$2.0552 (+5.0% net)

Stop loss: \$1.8896

Size: 51 sh (~\$99)

Est. round-trip costs: 0.67% (already baked into targets)

Line	What it means	What you do in Robinhood/Webull
BUY ENTRY	The exact price to buy at.	Place a LIMIT buy at this price. Never use a market order.
SELL ENTRY	The exit that nets you at least +3% after all fees and slippage.	Right after your buy fills, place a LIMIT sell at this price.
Stretch target	The +5% net exit if the stock runs.	Optional: use instead of SELL ENTRY if momentum is strong.
Stop loss	Where to bail to cap the loss (~2.5% net).	If price drops here, sell. (Set an alert or a stop order.)
Size	Shares matching your configured \$ per trade.	Buy this many shares (or fewer).

You'll also get exit messages: ■ **SELL — TARGET HIT** when the sell entry is reached, or ■ **SELL — STOP** if the stop loss triggers. Each shows the price and the net P/L percentage.

Premarket and after-hours: brokers only accept limit orders in extended hours — which is what the signals give you anyway. Expect fewer signals there; spreads are wider and the app filters harder on purpose.

Inviting Other People (invite-only)

Nobody can receive your signals without a code from you. Each code works exactly once.

1. In Telegram, open the chat with **your own bot** and send: **/invite**
2. The bot replies with a one-time code, e.g. **9F3A61BC**.
3. Tell your friend: "Open Telegram, search **@YourBotName**, and send it: **/start 9F3A61BC**"
4. They instantly start receiving every signal. You get a notification that they joined.

Your admin commands (only work from your account): **/invite** — new code · **/subscribers** — see who's on the list · **/revoke <id>** — remove someone · **/myid** — show a chat id. Subscribers can leave anytime with **/stop**.

Day-to-Day Operation

Every trading day: make sure the black window is running (python main.py). That's it. Signals arrive on their own from 7:00 AM to 8:00 PM ET. Weekends it sleeps.

When a signal arrives: open Robinhood or Webull, place a limit BUY at the buy entry, then a limit SELL at the sell entry. Skip any signal you don't like — they're suggestions, not commands.

Quiet days are normal. The filters demand tight spreads, real liquidity, and enough room to clear 3% net after costs. No qualifying setups = no messages. Every signal is also logged to signals.csv so you can review history.

Troubleshooting

“pip is not recognized” — Python wasn't added to PATH. Reinstall Python and CHECK the “Add Python to PATH” box on the first screen.

No “online” message when starting — Token or chat ID is wrong in config.yaml. Rerun python get_my_chat_id.py — it validates the token and re-finds your ID.

Bot doesn't reply to /invite — The app (main.py) must be running — the bot lives inside it. Also /invite only works from YOUR account (the admin_chat_id).

Friend's code rejected — Codes are one-time. Send /invite again for a fresh code per person.

No signals all day — Usually normal. To see more (lower-quality) candidates, lower min_avg_dollar_volume or raise max_spread_pct in config.yaml, then restart the app.

Signals stopped mid-day — PC went to sleep or the window was closed. Set power/sleep to Never and restart with python main.py.

“Universe fetch failed” in the log — The stock-listing service hiccuped; the app retries and falls back to a 6-hour cache. Only worry if it persists for hours.

Reminder: signals are computed targets, not guarantees — expect some stopped-out losers; the stop loss caps them. Nothing in this guide is financial advice. Auto-execution stays OFF unless you deliberately enable it in config.yaml (see README for the risks with Robinhood/Webull).
